Short Course on Electric VTOL Technology

COURSE DESCRIPTION / OVERVIEW:

The Vertical Flight Society’s signature eVTOL class offers in-depth coverage of industry-standard battery systems development (BAE), advanced high-power hybrid-electric hardware (LaunchPoint), PEM fuel cells and hydrogen propulsion and as always, the fundamentals of Vertical Lift and rotor aeromechanics from design to state-of-the-art in acoustics (Alfred Gessow Rotorcraft Center, University of Maryland).

Electric Vertical Take Off and Landing aircraft – or eVTOL – are aircraft propelled by electric power and capable of carrying people. There has been a dramatic resurgence of interest in these aircraft, driven by advances in electric-propulsion, digital manufacturing, high-fidelity simulations, and drone technologies (mobile computing and deep-learning). However, man-rated aircraft are more complex than drones, and require more than a clever combination of scaled-up components from consumer electronics and automobiles. Maturation of eVTOL into a safe, sound, and sensible aircraft require a clear understanding of rotary-wing fundamentals, principles of enabling technologies and timely resolution of its major barriers. The objective of this course is to introduce these fundamentals, technologies and barriers.

Led by Anubhav Datta, Alfred Gessow Rotorcraft Center, University of Maryland, this multi-presenter course will provide an overview of the unique challenges and opportunities of this new class of vehicles. Both electric and hybrid-electric passenger carrying vertical flight aircraft will be covered for a variety of missions ranging from personal/private use to urban air taxis to regional electric VTOL bizjets.

WHO SHOULD TAKE THE COURSE:

Aerospace engineers interested in electric power. Electrical / Mechanical engineers interested in VTOL aircraft. The content will be presented in a simplified and practical manner to allow innovators, entrepreneurs, and non-VTOL experts to be able to make useful calculations and build their own design / simulation tools. The content will be presented in a simplified and practical manner aimed to engage a wide audience of mixed aerospace and non-aerospace background. A
simplified multi-rotor VTOL aircraft will be designed and analyzed in class, progressively, as an illustrative example.

Power point course notes will be emailed to all registered participants before the class.

INSTRUCTORS

Anubhav Datta, Associate Professor, University of Maryland
Joshua Stewart, BAE Systems
Michael Ricci, LaunchPoint Electric Propulsion Solutions
James Baeder, Samuel P. Langley Distinguished Professor, University of Maryland

COURSE CONTENTS

I. Fundamentals: Rotors, Aircraft, and Integrated Electric Power
Anubhav Datta, Associate Professor, Alfred Gessow Rotorcraft Center

Introduction
- Why eVTOL? Why now? A brief history
- State-of-the-art in aircraft, battery, and motor
- Single vs. distributed
- Sizing an example eVTOL
- The connection to infrastructure

Rotor aeromechanics
VTOL aircraft
- Basic aerodynamics and performance
- Rotors vs. propellers vs. prop-rotors
- Coaxial and shrouded rotors
- Blade structural dynamics and loads
- eVTOL controls and trim
- Example Quadrotor and Tiltrotor

Electric power
- Power architecture
- Brushless permanent magnet motors
- Engine-generator hybrid
- Lithium ion and Sulfur batteries
- PEM fuel cells and hydrogen storage

II. Sizing Advanced Battery Systems for eVTOL Application
Joshua Stewart, Principle Power Systems Engineer, BAE Systems

- Definitions
- Describe battery operations and management
• Fundamentals of safe management and control
• Detail elements of battery packaging
• Discuss battery modeling
• Discuss battery fuel gauge concepts
• Relate electrical and thermal elements to basic first principles
• Detail how systems are sized
• Assess battery performance (example)
  o Power
  o Energy
  o Size
  o Weight
  o Life
  o Cost
• Review development standards and testing

III. Brushless Permanent Magnet Machines and motor drives for Aircraft.
Michael Ricci, LaunchPoint Electric Propulsion Solutions

• Basic PM motor physics for aeronautical engineering
• PM motor types and geometries (radial and axial flux)
• Motor performance metrics: size, weight, efficiency, torque, speed
• Characteristics and performance
• Designing a PM motor: sizing, weights and efficiencies
• Gearboxes
• Operating modes: motor vs generator
• Fundamental operation principles and sizing of Motor Drives
• Introduction to EMI concerns and mitigation
• Electric Tail rotor example

IV. eVTOL and UAM noise
James Baeder, Samuel P. Langley Distinguished Professor, Alfred Gessow Rotorcraft Center

• Definitions
• Fundamentals of rotor acoustics
• Types of noise: broadband, rotational, and impulsive noise
• Ffowcs Williams and Hawkings Model
• Method to calculate noise
• Lifting-line versus CFD inputs
• Single versus multiple rotors
• Hover and forward flight
• Active control of noise
• Fundamental limits
• How quiet is quiet enough?
Anubhav Datta is a member of the Alfred Gessow Rotorcraft Center (AGRC) and an Associate Professor of Aerospace Engineering at the University of Maryland at College Park. He holds a M.S. and Ph.D. in Aerospace Engineering from Maryland. He re-joined AGRC as faculty in 2016 after nine years at the U. S. Army Aviation Development Directorate (ADD) at NASA Ames Research Center. At Maryland, Datta and his students are focused on future vertical lift barriers through Mach-scale wind-tunnel tests and HPC-based high-fidelity simulations. The research conducted by Datta and his colleagues have led to new fields in VTOL such as Mars Helicopter (2000), CFD/CA (2004), and eVTOL (2012). Over the years his work has been recognized by the VFS Grover E. Bell and Alfred Gessow Awards, NASA Technical Excellence in Publications Award, and U.S. Army and NASA Group Achievement Awards. Datta is the founder and inaugural chair of the VFS eVTOL Technical Committee, Chair of the AIAA Structural Dynamics Sub-committee on Conferences, and Associate Editor of the Journal of the American Helicopter Society.

Joshua Stewart is a Principle Power Systems Engineer at BAE Systems and a member of the VFS. He has been working in the aerospace industry for over 10 years. Over the last 5 years, Josh has been a technical leader in the development of high-power, high-voltage battery systems for aircraft propulsion at BAE Systems. Josh is involved with the analysis and development of electric and hybrid electric aircraft propulsion systems, including Li-Ion battery storage, high-fidelity battery management systems, high voltage power distribution, motor drives and cables. He has played a critical role in the development of aircraft propulsion solutions for CTOL and eVTOL aircraft. With a strong background in flight-critical avionics and energy storage for ground transit, Josh has been able to apply a broad systems approach to the design of battery systems, including design for thermal runaway propagation and containment. He holds a B.S. degree from Binghamton University and a M.S. degree from Worcester Polytechnic Institute in Mechanical Engineering.

Michael Ricci is the Chief Technology Officer of LaunchPoint Electric Propulsion Solutions, and the driving force behind LaunchPoint’s “Propulsion By Wire” electric aircraft propulsion effort. He spent the last 8 years as PI on a number of projects to develop electric aircraft propulsion technologies. These projects have included the development of highly efficient and powerful dual halbach array motors, high specific power wide bandgap semiconductor motor drives, and hybrid-electric gen-sets and bus power management systems. Applications have included HALE vehicles, helicopter electric tail rotors, multi-rotors, eVTOL vehicles, and turbogenerators. During Mike’s 17 year tenure at LaunchPoint he has worked on flywheel energy storage, implantable heart assist pumps, medical oxygen concentrators, engine valve actuators, and a magnetically-levitated freight transportation system. Prior to joining LaunchPoint, Mr. Ricci worked as a mechanical engineer with Spectra F/X, a theme park engineering company, where he served as Project Engineer on several very large custom systems with high cycle rates, intimate man-machine interfaces, and high human-safety concerns.
**James Baeder** is a member of the Alfred Gessow Rotorcraft Center as a Professor of Aerospace Engineering at the University of Maryland at College Park. He is currently the Samuel P. Langley Distinguished Chair at the National Institute for Aerospace. He holds a M.S. and Ph.D. in Aeronautics and Astronautics from Stanford University. He joined the AGRC in 1993 after nine years at AFDD. His research interests are in developing and applying Computational Fluid Dynamic methods to better understand rotor aerodynamics, acoustics and dynamics. He is a pioneer in the development of high-fidelity CFD and aeroacoustic methods and tools for rotorcraft. Currently he is focused on the development of improved CFD algorithms on GPGPU technology, to: capture the details of laminar/turbulent transition; dynamic stall; as well as tip vortex formation, convection and interaction with other surfaces including fuselages, towers or the ground and including adjoint capabilities. Dr. Baeder's research has been funded by Excelon, NASA Ames and Langley, the Army Aeroflightdynamics Directorate, the Army Research Office, the National Rotorcraft Technology Center, NAVAIR and DARPA, with support from the various helicopter companies, Dr. Baeder is a Technical Fellow of the American Helicopter Society, member of the Acoustics Technical Committee (1996-present), member of the Aerodynamics and Propulsion Area Committee, and Chairs the Innovation and Commercialization Committee of the Business Network for Offshore Wind as well as the National Offshore Wind Innovation Center.
